# ◉ Lumen

Prototype · English · text only

**Executive Brief**
27 October 2026
Stakeholder leave-behind

BEFORE YOUR APPOINTMENT

# A clearer conversation starts with understanding the report.

Lumen is a cautious, source-grounded prototype that helps people make sense of wording in a cancer pathology report and prepare neutral questions for their care team — without diagnosing, predicting outcomes, or recommending treatment.

### Who it is for

Adults and caregivers preparing for a care-team visit after receiving a cancer-related report, especially when the language feels unfamiliar.

### What success looks like

A person can point to exact report wording, see what is and is not stated, and walk into the appointment with better questions — still confirming every meaning with a clinician.

WHY THIS MATTERS

### Before the appointment, understanding starts with the words on the page

THE MOMENT

**A report arrives early**

Portals and paper can surface technical wording before anyone has had time to explain it.

**Confusion is understandable**

THE NEED

**Clarity without overreach**

People want to know what the document says, where each idea came from, and what to ask next.

**Not a second opinion engine**

THE LUMEN PROMISE

**A cautious briefing**

Source-linked wording, honest gaps, and neutral questions for the care team.

**Confirm meaning with a clinician**

Figure 1. The moment, the need, and Lumen's carefully bounded promise.

## The product promise, in one breath

- Explain only wording that is present in the submitted excerpt.
- Link every shown statement to an exact quotation.
- Keep missing information as "not stated," rather than guessing.
- Offer neutral questions that support — never replace — clinical conversation.

**Important:** Lumen is a synthetic-only software prototype. It is not medical advice, not a diagnostic tool, and not clinically validated. It is not ready for patient use.

## Boundaries that build trust

Lumen treats limited scope as a design feature. It will help with report wording and appointment questions. It will refuse prognosis, treatment ranking, dosing, trial eligibility, and urgent-symptom triage.

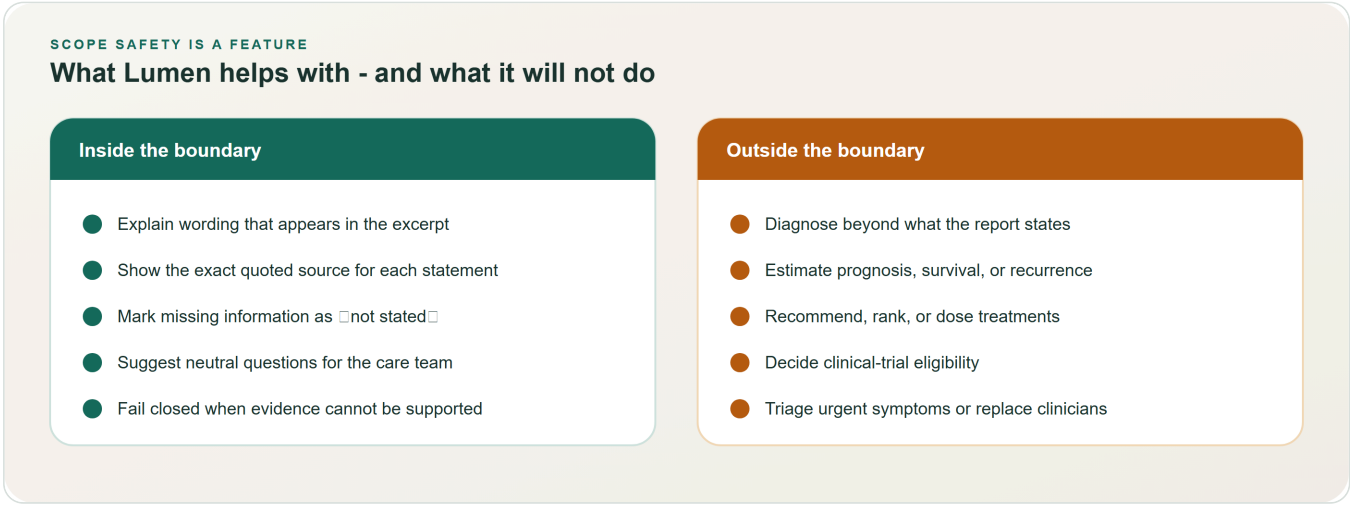

Figure 2. Inside versus outside the product boundary.

## How a statement earns its place

Shown statements must pass an evidence gate: the cited wording must match the submitted excerpt, a separate verification step must support the claim, and safety boundaries must hold. If they do not, Lumen withholds the claim or returns a fixed refusal.

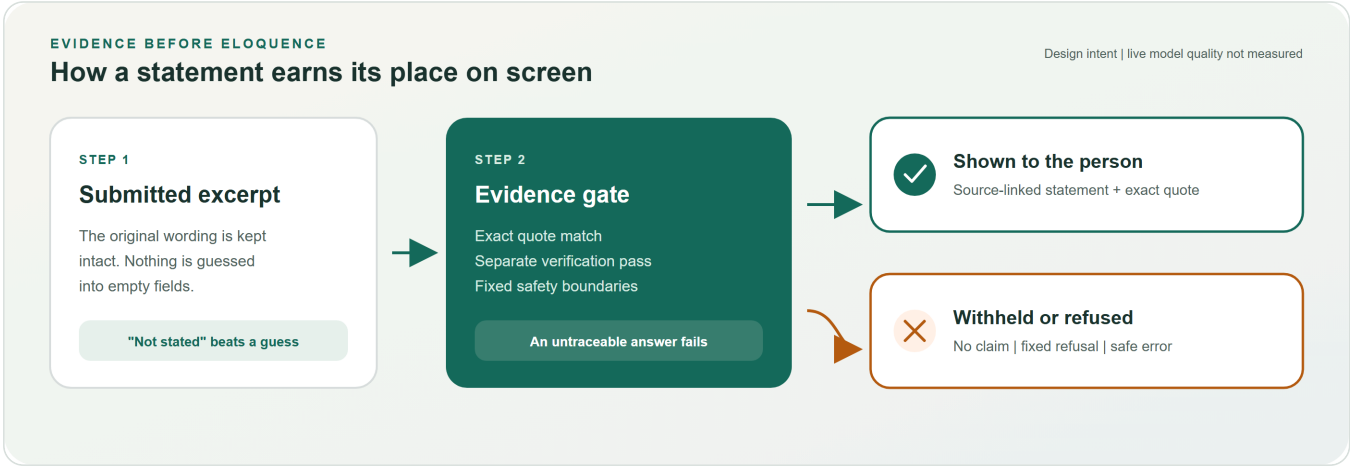

Figure 3. Supported path versus withheld or refused outcomes.

## Current honesty check

- Demo posture: model provider disabled by default; live path returns no claims.
- Positive result screens in demos are labeled synthetic UI fixtures, not live model answers.
- Automated software checks exist; clinician review and clinical validation have not been completed.
- Responsible next step: independent clinical and patient review of task, language, and evaluation — before any real-world use is considered.

**Share line:** Before your appointment — understand the report, see the exact words, ask better questions. Prototype, not medical advice.
